

# E-commerce Mobile App - Low Fidelity Wireframes

## Task 1: Mobile App Wireframing

Project: E-commerce Mobile Application

Student: Rayan Hobballah

### 1. User Research

I talked to 3 friends who shop online regularly on mobile.

They need a fast and simple way to find products and checkout.

Main problems: Too many steps to buy, confusing navigation, no cash on delivery.

What users want: Search, filters, clear product info, quick checkout in 2 minutes.

### 2. User Persona

Name: Reem

Age: 22

Occupation: Student

Location: Lebanon

Goal: Buy affordable clothes and shoes quickly on her phone

Behavior: Shops at night, looks for discounts, uses mobile only

Pain points: Long checkout, hidden charges, complicated address form

### 3. User Flow

Login / Signup -> Home Page -> Browse Categories -> Product List ->

Product Detail Page -> Add to Cart -> My Cart -> Checkout -> Order Success ->

Profile / My Orders / Settings

### 4. Wireframes

Tool: Figma

Style: Low-fidelity wireframes - only boxes and lines

Total Screens: 5

- Screen 1: Login / Signup
- Screen 2: Home (Discovery)
- Screen 3: Product Detail
- Screen 4: Cart
- Screen 5: Profile / Checkout Success

### 5. Design Thinking Process

Empathize: Understood user needs for simple shopping

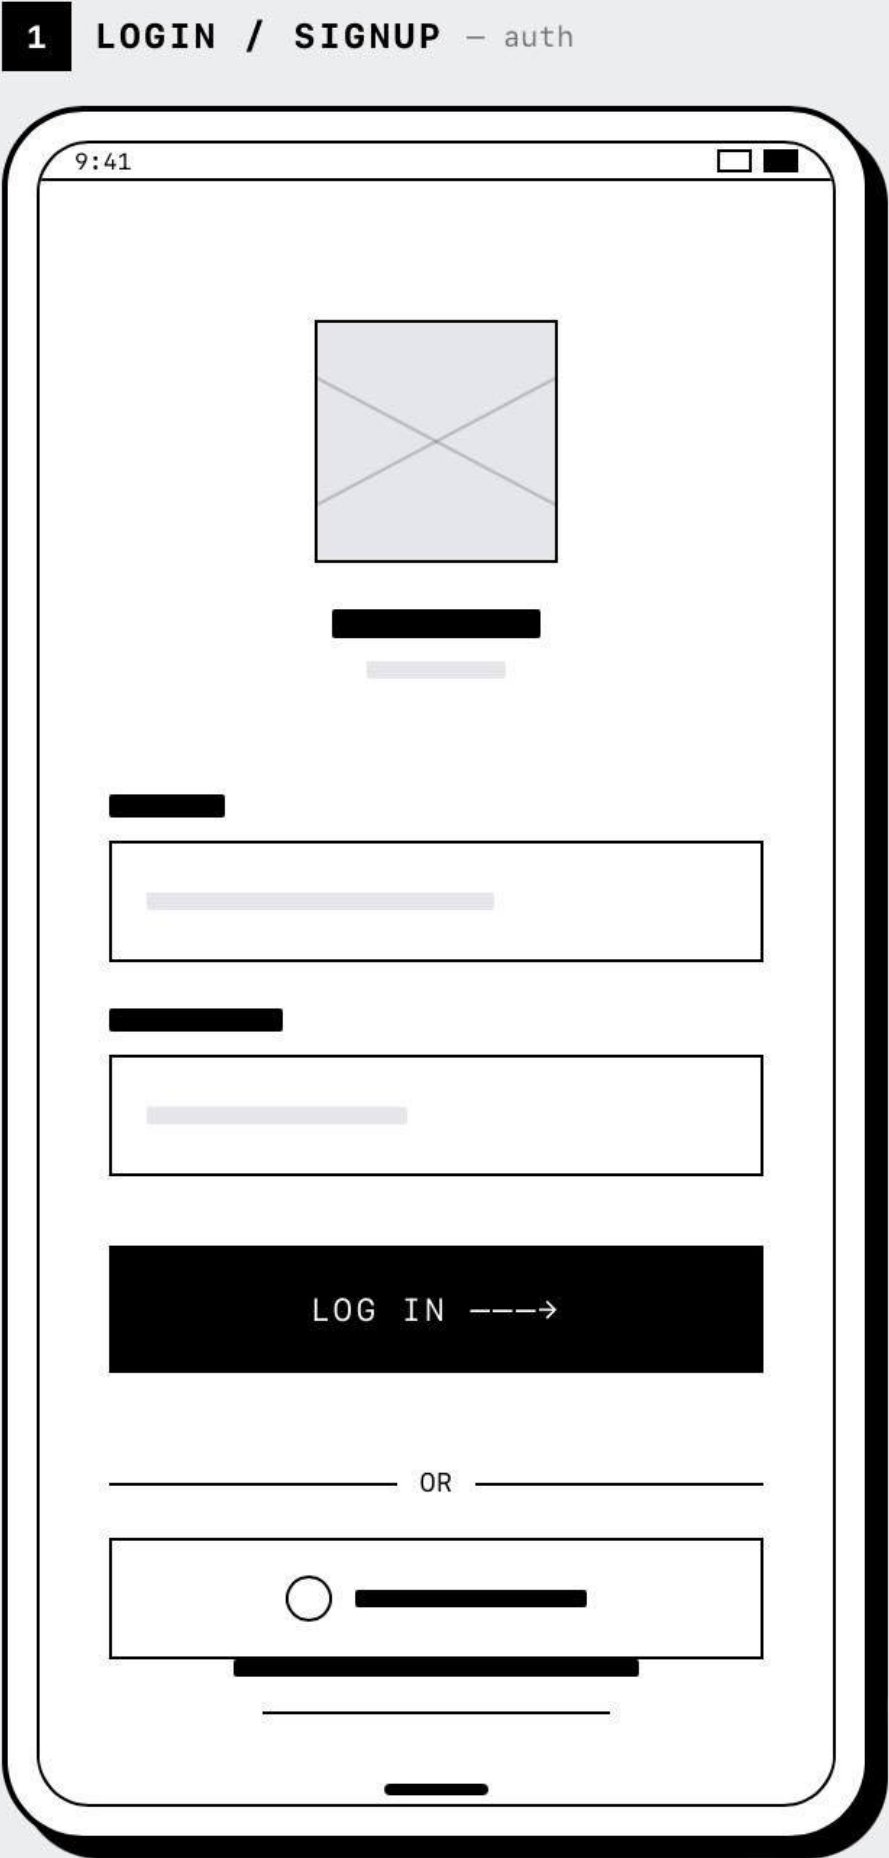

Define: Main problem is complex checkout process

Ideate: Created 3 different flow ideas for 3-click purchase

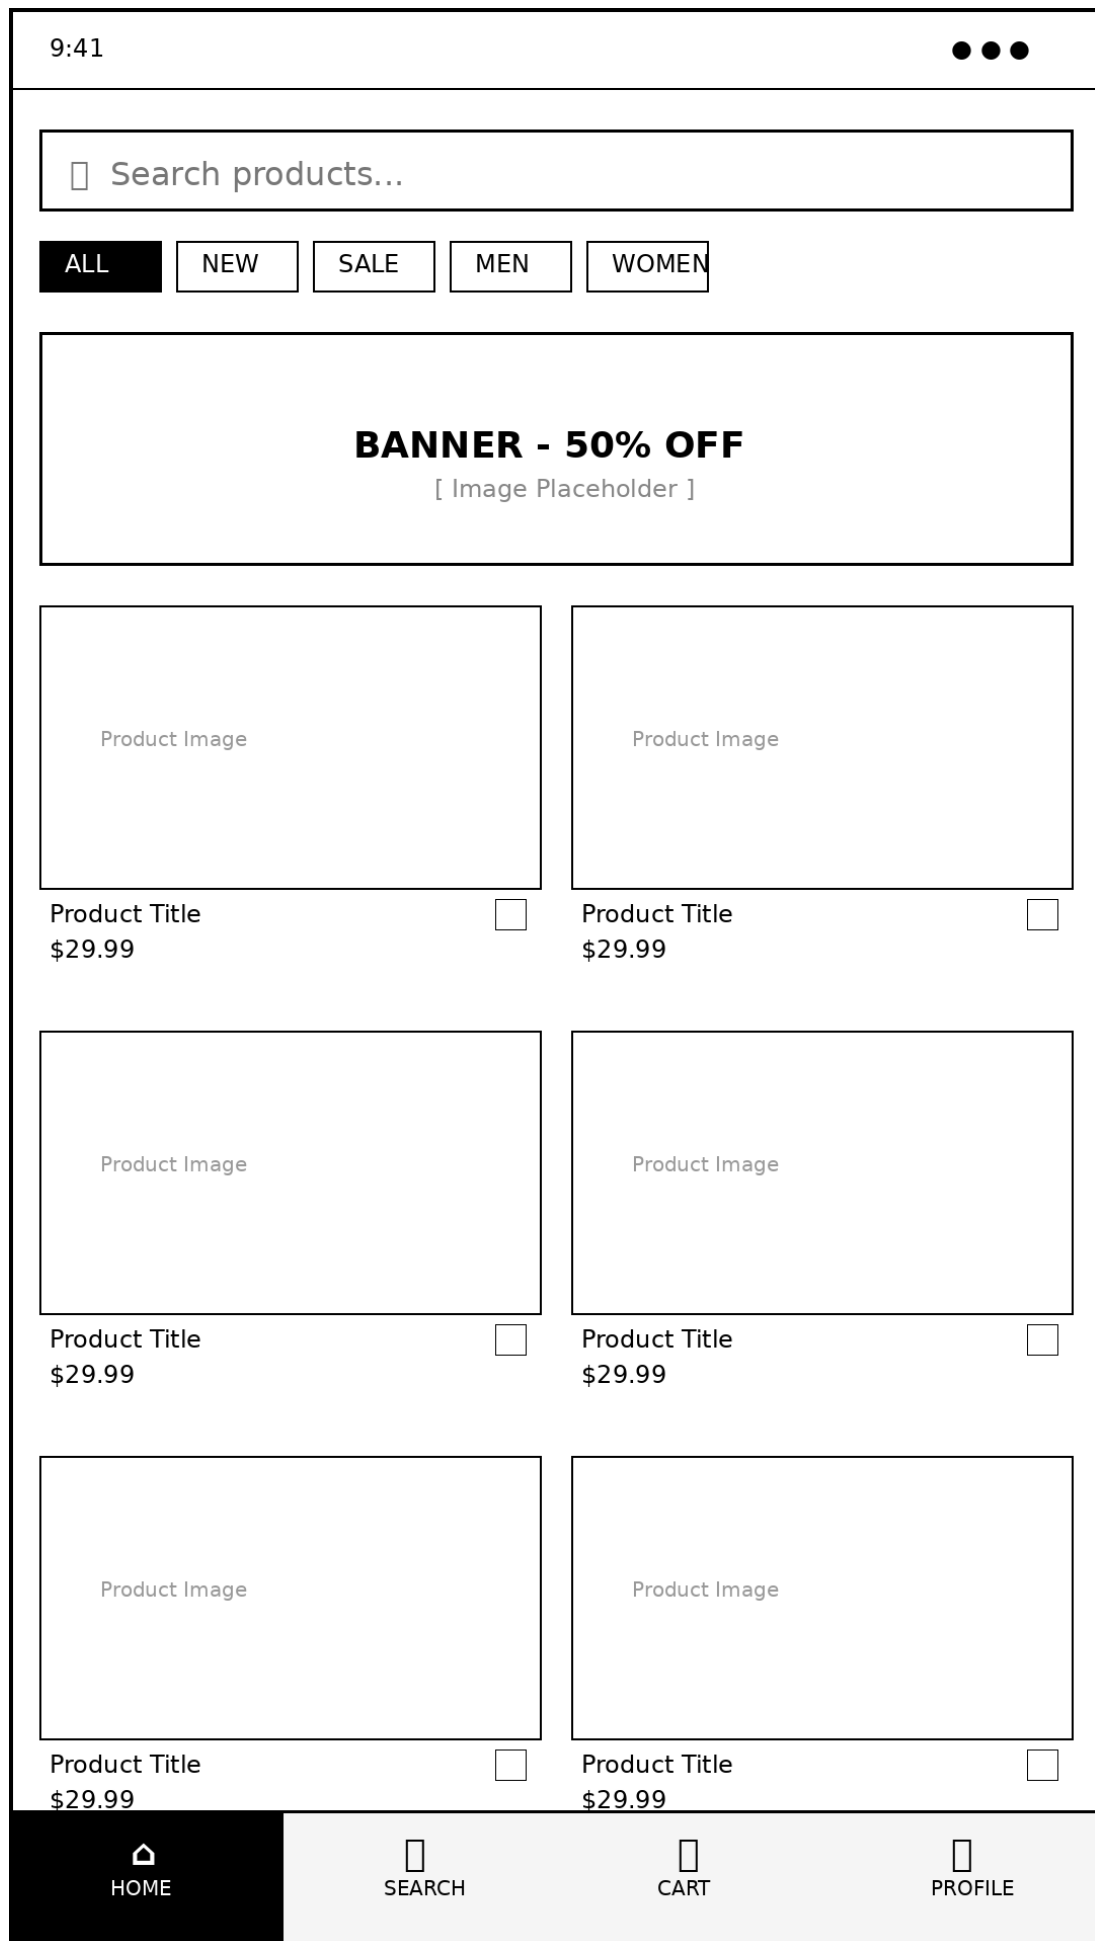

Prototype: Designed 5 low-fidelity screens

Test: Plan to test with 2 users if they can complete purchase quickly

Screen 1: Login / Signup

## Screen 2: Home - Discovery

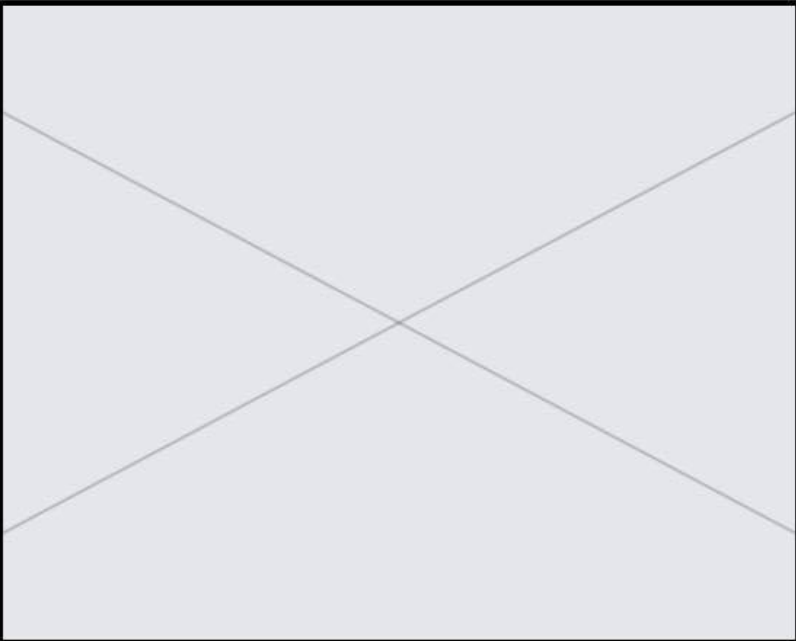

Screen 3: Product Detail
